

Please consider giving more time to ARRL and other agencies, including the National Communications System to complete and submit data proving that BPL will cause significant interference to HF radio communications. Permitting BPL will put our entire HF communications system in peril. If this happens, then someone will be held responsible in the event of a national disaster that requires reliable HF radio communications. In addition, this BPL system is not secure and can result in data being intercepted because of signals radiating from the power lines. Last, there are very few areas of this country that are not already adequately served by reliable non-interfering ISP's. BPL is a disaster waiting to happen!
